

# **PIN120**

## **Add new code to keypad**

If the master code is 123456 :

Enter 123456 + ENT

Then go 11 + ENT

Then "ID Number" + ENT (ID Number is from 001 – 512... If the number of codes is unknown then they could choose a random number or start a table or something)

So an example would be to add the code 1234 to ID 20:

123456+ENT / 11+ENT / 20+ENT / 1234+ENT

I think you then press ESC to exit programming.

If the master code is unknown, then they have to rip it off the wall, short the brown and white wires to default and start again.
